WITHIN REACH – AND STILL NO CONTACT

Objects sometimes appear closer than they really are. The proximity sensors from SICK, however, are not fooled when detecting objects. They detect objects with utmost precision. And, sensor accuracy is not affected by the material of the approaching target object. Whether metal or other solid materials such as wood or paper, liquids, granules or permanent magnets, the solution for your application is within reach with the proximity sensors from SICK.

A WE DELIVER “SENSOR INTELLIGENCE.”

SICK sensor solutions for industrial automation are the result of exceptional dedication and experience. From development all the way to service: The people at SICK are committed to investing all their expertise in providing with the very best sensors and system solutions possible.

A company with a culture of success

Almost 7,000 people are on staff, with products and services available to help SICK sensor technology users increase their productivity and reduce their costs. Founded in 1946 and headquartered in Waldkirch, Germany, SICK is a global sensor specialist with more than 50 subsidiaries and representations worldwide. The people work with pleasure at SICK.

This is demonstrated by the accolades that the company is regularly awarded in the “Great Place to Work” competition. This lively corporate culture holds strong appeal for qualified and skilled persons. In SICK, they are part of a company that ensures an excellent balance between career progression and quality of life.

Innovation for the leading edge

SICK sensor systems simplify and optimize processes and allow for sustainable production. SICK operates at many research and development centers all over the world. Co-designed with customers and universities, our innovative sensor products and solutions are made to give a decisive edge. With an impressive track record of innovation, we take the key parameters of modern production to new levels: reliable process control, safety of people and environmental protection.

A corporate culture for sustainable excellence

SICK is backed by a holistic, homogeneous corporate culture. We are an independent company. And our sensor technology is open to all system environments. The power of innovation has made SICK one of the technology and market leaders – sensor technology that is successful in the long term.

A

“SENSOR INTELLIGENCE.” FOR ALL REQUIREMENTS

SICK is a renowned expert in many industries, and is entirely familiar with the critical challenges they face. While speed, accuracy and availability take center stage in all industries, technical implementations vary greatly. SICK puts its vast experience to use to provide with precisely the solution you need.

For applications worldwide

Hundreds of thousands of installations and applications go to prove that SICK knows the different industries and their processes inside out. This tradition of uncompromising expertise is ongoing: As we move into the future, we will continue

to design, implement and optimize customized solutions in our application centers in Europe, Asia and North America. You can count on SICK as a reliable supplier and development partner.

For your specific industry

With a track record of proven expertise in a great variety of industries, SICK has taken quality and productivity to new heights. The automotive, pharmaceutical, electronics and solar industries are just a few examples of sectors that benefit from our know-how. In addition to increasing speed and improving traceability in warehouses and distribution centers, SICK solutions provide accident protection for automated guided vehicles. SICK system solutions for analysis and flow measurement of gases and liquids enable environmental protection and sustainability in, for example, energy production, cement production or waste incineration plants.

For performance across the board

SICK provides the right technology to respond to the tasks involved in industrial automation: measuring, detecting, monitoring and controlling, protecting, networking and integrating, identifying, positioning. Our development and industry experts continually create groundbreaking innovations to solve these tasks.

A SERVICES FOR MACHINES AND SYSTEMS: SICK LifeTime Services

SICK LifeTime Services is a comprehensive set of high-quality services provided to support the entire life cycle of products and applications from plant walk-through to upgrades. These services increase the safety of people, boost the productivity of machines and serve as the basis for our customers' sustainable business success. LifeTime Services range from product-independent consulting to traditional product services and are characterized by extensive industry expertise and more than 60 years of experience.

- Customized analyzer systems
- Collision awareness systems
- Robot guidance systems
- Object detection systems
- Profiling systems
- Quality control systems
- Security systems
- Track and trace systems
- Functional safety systems

B

MATERIAL IS NOT EVERYTHING

Complex problems are often characterized by many different requirements. It is not an easy task to find a suitable solution in such situations. SICK is happy to take on these challenges with the declared objective of finding a special solution for every application.

■ Fields of application

- Factory automation, page B-14

- Safe position monitoring of machine parameters, page B-22

FACTORY AUTOMATION

B

Wear-free and in practical terms unaffected by external influences, inductive proximity sensors detect the presence and distance of metallic objects. This means they are ideally suitable for a variety of detection, counting and positioning tasks in factory automation.

The most important requirements for inductive sensors are precision, maximum availability, and a long service life. Inductive sensors from SICK pack advanced technology into the smallest of spaces. Due to improved production tolerances, SICK sensors with ASIC technology deliver much higher

precision than standard discretely mounted devices. They are not digitally synchronized until after the production process is complete, essentially ruling out production-related tolerances of the sensing range. Even the high level of electromagnetic compatibility of the sensors is a result of state-of-the-art ASIC. A molded housing interior, which completely encapsulates the electronics, greatly increases shock and vibration resistance. The customer benefits from high positioning accuracy in the machine and long-term reliability.

ZONES WITH COOLANTS AND LUBRICANTS

B

Cutting oils and cooling lubricants are extremely aggressive towards system components and often cause sensor malfunctions. The IMB sensor family is designed for frequent contact with these materials. Thanks to its sturdy design and mechanical resistance to nearly all common cutting oils and cooling lubricants, the IMB sensor family sets a new standard for inductive proximity sensors in machine tools construction in particular.

Typical applications

- CNC machining centers
- Tool changers
- Workpiece handling

Advantages

- Optimal resistance against oils and cooling lubricants
- Extreme mechanical ruggedness
- Quick and easy mounting due to optical adjustment indicator
- High degree of flexibility and communication options thanks to IO-Link

For metals

IMBC-76

HYGIENIC AND WASHDOWN ZONES

B

Flawless reliability and durability are key requirements when using sensors in hygienic and washdown zones. In the pharmaceutical and the food and beverage industries, washdown environments represent just one type of challenge: The sensors must also be able to withstand the daily high-pressure cleaning process, along with high thermal and mechanical loads.

While the use of rugged materials and the capacity for thorough cleaning are the main priorities for process automation, high levels of accuracy, rapid response times, straightforward commissioning, and the option to run diagnostics on sensors remotely are key factors within factory automation. Inductive proximity sensors cover all options by delivering maximum automation performance while also complying with the demands of the food industry. Extended, highly accurate

sensing ranges mean that reliable switching behavior is guaranteed, even in the event of dramatic changes in temperature. The materials used – including stainless steel and LCP – have been approved by the FDA. The sensor is certified by Ecolab and is extremely watertight with enclosure ratings IP 68 and IP 69K. The option of communication via IO-Link opens up new opportunities for configuration and diagnostics.

SICK stainless steel sensors stand up to test with long-term, reliable operation and maximum availability with the help of these four criteria:

- Chemical resistance
- Thermal resistance
- Tightness
- Market standards

Chemical resistance

A stainless steel sensor by SICK is resistant to high-pressure cleaning, cleaning with foam or P3 cleaning agents, and subsequent rinsing. The LCP front cap and the LED windows are resistant to all cleaning agents typically used in this industry.

Thermal resistance

Stainless steel sensors are subjected to dramatic changes in temperature resulting from cleaning with water at approx. 80 °C in a cold environment at between 5 and 10 °C, for example. Constant changes in temperature cause what is known as the pump effect: The differences in pressure “pull” moisture into the device. The highly resistant plastics, along with the stainless steel, are able to resist the temperatures, and the tightly sealed housing suppresses the pump effect.

Water tight

SICK stainless steel sensors have been proving their worth in practical applications for many years. The tightness of the sensors is due to the special mold which, combined with an O-ring seal, completely encapsulates the electronic components. With a water shock test, tests for enclosure ratings IP 66, IP 67, IP 68, and IP 69K, and a service life test, tightness is tested on a regular basis.

Market standards

Thanks to careful material selection and well-thought-out design and build, the stainless steel version of the proximity sensors from SICK meet all legal requirements and are aligned with the following standards and directives:

- DIN 10516: 2009-05
- DIN EN ISO 14159: 2008-07
- DIN EN 1672-2: 2005 + A1
- Machinery Directive 2006/42/EC
- Directives 1935/2004/EC and 10/2011
- Designed according to EHEDG guidelines
- Ecolab-certified
- Materials meeting FDA requirements

HARSH ENVIRONMENT APPLICATIONS

B

Some situations demand significant reliability and toughness. Inductive proximity sensors from SICK are a multi-purpose solution in this area. Equipped with all features the market demands, they are able to deal with any situation. Regardless of the challenges presented by the site of operation. In the end, opting for SICK proximity sensors is a simple decision.

Typical applications

- Container spreaders
- Wind power plants
- Car wash facilities
- Outdoor gates and barriers

When outdoors or anywhere with difficult ambient conditions, SICK proximity sensors utilize their strengths in a particularly impressive way. One sensor covers a variety of applications.

Advantages

- Protected against water
- Immune to temperature fluctuations
- Mechanically rugged
- Shock and vibration resistant
- Corrosion-resistant

For metals

IMI	C-108	IQG	C-164

A selection guide for inductive proximity sensors can be found on page C-26.

EXPLOSION-HAZARDOUS AREAS

B

Potentially explosive atmospheres can arise wherever dust, flammable gases, or flammable liquids are manufactured, transported, processed, or stored. An explosion can occur if three factors come together at the same time:

- A flammable substance, e.g., in the form of gas, vapor, mist, or dust, is present
- Sufficient oxygen is present (e.g., in the ambient air)
- There is an ignition source. In addition to sparks, this can also include hot surfaces or optical radiation energy.

SICK offers sensors that have been developed especially for explosion-hazardous areas. Based on directive 2014/34/EU, these sensors are designed in accordance with the relevant standards.

SICK proximity sensors are available for the following EX fields of application

Responsibility of the sensor manufacturer	Responsibility of the machine manufacturer					
Category	Can be used in zone (gas)	Can also be used in zone (gas)	Can be used in zone (dust)	Can also be used in zone (dust)	Definition 2014/34/EU potentially explosive atmospheres is present	Certification by
1G/1D	0	1 and 2	20	21 and 22	Always, for long periods, or often	Notified body
2G/2D	1	2	21	22	Occasional	Notified body

G = gas; D = dust.

MM Namur F-240

LEVEL MEASUREMENT

B

Level and feed monitoring is the specialty of the capacitive proximity sensors. From solid material, such as paper or wood, to granules or liquids, the sensors quickly and reliably detect the status of the product during accelerated production process and final inspection.

The sensors are also remarkably resistant to faults. Impurities, contamination, dust, and airborne spray particles have little effect on them, nor does electromagnetic interference. In addition, their sensitivity can be quickly and easily adjusted to changing ambient conditions. Thanks to their compact design, the capacitive proximity sensors need very little installation

space and really live up to their potential in very tight spaces. The non-contact measurement function makes drill holes in containers or tank walls unnecessary and enables quick installation. It's no wonder that they are used in a wide variety of industries, such as the food or the automotive industry as well as in storage and conveyor systems.

For liquids, bulk materials, other solids

CM	E-206
CM PTFE	E-214
CQ	E-218

A selection guide for capacitive proximity sensors can be found on page E-202.

OBJECT DETECTION BEHIND SURFACES

B

SICK proximity sensors ensure the right view through nearly any conceivable material. They are the ideal solution for applications in which objects have to be detected through surfaces.

Whether for storage containers, covers or other surfaces and obstacles: The magnetic and capacitive proximity sensors from SICK reliably provide the relevant background information on the objects located behind the surface. This enables spatial separation of object and sensor and makes it possible to install the sensor in a protected area without contact with aggressive media, dirt or moisture.

The ideal type of proximity sensor depends on the respective application. Capacitive proximity sensors detect various materials without making contact, therefore enabling quality and presence monitoring.

Magnetic proximity sensors reliably detect permanent magnets and allow very high sensing ranges – even for the detection of objects behind surfaces.

Advantages

- Reliable detection (e.g. level monitoring through container walls) without the sensor coming into contact with aggressive media
- Protected assembly of the sensor or the magnets is possible, e.g. if application conditions are rough (applications outdoors, in agricultural or construction machines)
- Reliable detection regardless of dirt by using permanent magnets
- Very high sensing ranges of up to 120 mm possible

A selection guide for magnetic proximity sensors can be found on page F-228.

SAFE POSITION MONITORING OF MACHINE PARAMETERS

B

In addition to inductive proximity sensors, inductive safety sensors are also used in machines; these sensors primarily implement safety-related functions, not automation functions. With a defined safety level, machine manufacturers, operators and users can rely on the safety of the machine.

In the last few years, awareness of safe machines has grown along with increasing degrees of automation. Consequently, requirements on the protective devices in machines are constantly growing and are also specified in guidelines. In safety technology, a certain level of safety is required depending on the application. This level of safety is, on the one hand, achieved by organizational and technical measures of functional safety, and on the other hand, by the detection of unwanted errors as well as the reduction in manipulation incentives for people.

The inductive safety sensor detects metallic objects like an inductive proximity sensor. If the metallic object deviates from the target position, the safety-related logic unit detects the safety-related signal and forwards it to the control elements in the safety chain (conductors, drives, valves). This stops the machine's dangerous movement.

In contrast to inductive proximity sensors for automation tasks, an inductive safety sensor contains mechanisms for detecting errors. As soon as the sensor detects an error, it switches the entire safety chain into a safe state by switching off the machine or a part of the machine. Inductive safety sensors from SICK are designed and tested in line with standards IEC 61508 and EN ISO 62061 in order to guarantee these functions. The safety-related parameters are specified in the technical data of the sensors.

INDUCTIVE PROXIMITY SENSORS

Reliable, powerful, rugged. Inductive proximity sensors from SICK

Millions of inductive proximity sensors are currently in use in virtually all industries. They detect metal objects without contact, and are characterized by a long service life and extreme ruggedness. With the latest ASIC technology, SICK's

sensors offer the ultimate in precision and reliability. SICK can provide the right solution to meet your requirements every time – from cylindrical or rectangular standard sensors with standard, extended or triple operating distance, to

special sensors for explosive zones and harsh environments. Our sensors are the intelligent, reliable route to implementing industry-specific and customized solutions to any task involving automation.

DC 3-wire
Stainless steel V4A
IP 68, IP 69K

- Types: M8 to M30
- Extended sensing ranges: 2 mm to 20 mm
- Electrical configuration: DC 3-/4-wire, DC 2-wire
- Enclosure rating: IP 68, IP 69K
- Temperature range: –40 °C to +100 °C
- Rugged stainless-steel housing; plastic sensing face
- Optical adjustment indicator, IO-Link-ready
- Resistant to oils and cooling lubricants; suitable for use outdoors

→ C-76

- Types: M8 to M30
- Extended sensing ranges: 2 mm to 20 mm
- Electrical configuration: DC 3- and 4-wire
- Enclosure rating: IP 68, IP 69K
- Temperature range: –40 °C to +100 °C
- Food-compatible stainless-steel housing, plastic sensing face
- Optical adjustment indicator, IO-Link-ready
- Resistant to industrial cleaning agents, Ecolab-certified

→ C-100

- Types: M8 to M30
- Triple sensing ranges: 6 mm to 40 mm
- Electrical configuration: DC, 3-wire
- Enclosure rating: IP 68, IP 69K
- Temperature range: –25 °C to +85 °C
- Food-compatible stainless-steel housing, stainless steel sensing face
- Sensing face made of food-compatible stainless steel
- Resistant against cleaning agents

→ C-108

MINIATURE SENSORS FOR INDUSTRIAL APPLICATIONS

Product description

The inductive proximity sensors in the IMM product family stand out from the crowd thanks to their low spatial requirements and high reliability. Their state-of-the-art ASIC technology offers miniaturization without compromise. And with maximum performance, sensing ranges of up to 4 mm, integrated electronics, suppressors, and output state LEDs, they offer everything you could possibly

want. Their small size and low weight make these inductive miniature sensors ideal for performing highly dynamic pick-and-place applications, integrating into compact assemblies, and monitoring faster handling and mounting processes. Thanks to the IO-Link communication, the sensors are also ideally equipped for future requirements.

At a glance

- Design: M4 to M5, diameter from 3 mm to 6.5 mm
- Extended sensing ranges: 0.6 mm to 4 mm
- Electrical configuration: DC 3-wire
- Enclosure rating: IP 67
- Temperature range: -25°C to $+70^{\circ}\text{C}$
- Rugged stainless-steel housing; plastic sensing face
- IO-Link ready
- Extremely compact, lightweight, and space-saving

Your benefits

- Easy installation in applications with limited available space
- Reliable detection of fast handling and mounting processes
- High positioning accuracy and precise switching behavior
- Great freedom with respect to machine design
- The low weight of the sensor enables fast acceleration in dynamic handling processes
- IO-Link provides easy data access from the PLC
- Simple sensor diagnostics, device change, and identification through IO-Link

Product description

SICK's inductive sensors offer precise detection, less downtime and a long service life. The inductive IME sensors pack high technology into the smallest of spaces. The integrated ASIC chip enables digital adjustment after the end of the manufacturing process. The saving of values in the ASIC ensures highly

precise switching points and very high repeatability of values – for any number of production runs. IM sensors are completely encapsulated with hotmelt molding, which greatly increases shock and vibration resistance. The customer benefits from high positioning accuracy in the machine and long-term reliability.

At a glance

- Types: M8 to M30
- Extended sensing ranges: 1.5 mm to 38 mm
- Electrical configuration: DC 2-wire
- Enclosure rating: IP 67
- Temperature range: –25 °C to +75 °C
- Nickel-plated brass housing; plastic sensing face

Your benefits

- High machine availability thanks to rugged design
- Highly cost-efficient thanks to low purchase costs
- Wide selection available thanks to extensive standard portfolio
- High positioning accuracy thanks to precise switching behavior

THE RUGGED STANDARD FOR USE IN HARSH AMBIENT CONDITIONS

Product description

The inductive IMB proximity sensor is a byword for reliability in harsh working conditions, whether it is in contact with cooling lubricants or being used outdoors. With its extended sensing ranges, made highly precise thanks to the use of SICK ASIC technology, the IMB ensures reliable, stable processes. What's more, its wide-ranging specification limits allow the IMB to be used in applica-

tions where specialist devices were once the only solution – a huge benefit when it comes to product selection and warehousing. The optical adjustment indicator and self-locking nuts save time during commissioning and help cut down on errors. With an extensive standard product portfolio available, even special devices can be put into action quickly and easily.

At a glance

- Types: M8 to M30
- Extended sensing ranges: 2 mm to 20 mm
- Electrical configuration: DC 2-wire
- Enclosure rating: IP 68, IP 69K
- Temperature range: -40 °C to +100 °C
- Rugged stainless-steel housing; plastic sensing face
- Optical adjustment indicator
- Resistant to oils and cooling lubricants; suitable for use outdoors

Your benefits

- Straightforward product selection as fewer sensor variants are required – one sensor suits a whole range of applications
- Stable processes thanks to extended, highly precise sensing ranges enabled through the use of the latest SICK ASIC technology
- Reduced machine downtimes thanks to longer sensor service life, even in harsh working conditions
- Quick and easy installation thanks to optical adjustment indicator and self-locking nuts
- Easy to implement customer-specific variants within the standard product portfolio

THE RUGGED STANDARD FOR USE IN HARSH AMBIENT CONDITIONS

Product description

The inductive IMB proximity sensor is a byword for reliability in harsh working conditions, whether it is in contact with cooling lubricants or being used outdoors. With its extended sensing ranges, made highly precise thanks to the use of SICK ASIC technology, the IMB ensures reliable, stable processes. What's more, its wide-ranging specification limits allow the IMB to be used in applications where specialist devices were once the only solution – a huge benefit

when it comes to product selection and warehousing. The optical adjustment indicator and self-locking nuts save time during commissioning and help cut down on errors. Communication via IO-Link is also possible, creating more flexibility and adding more functions for automation applications. With an extensive standard product portfolio available, even special devices can be put into action quickly and easily.

At a glance

- Types: M8 to M30
- Extended sensing ranges: 2 mm to 20 mm
- Electrical configuration: DC 3-/4-wire
- Enclosure rating: IP 68, IP 69K
- Temperature range: -40 °C to +100 °C
- Rugged stainless-steel housing; plastic sensing face
- Optical adjustment indicator, IO-Link-ready
- Resistant to oils and cooling lubricants; suitable for use outdoors

Your benefits

- Straightforward product selection as fewer sensor variants are required – one sensor suits a whole range of applications
- Stable processes thanks to extended, highly precise sensing ranges enabled through the use of the latest SICK ASIC technology
- Reduced machine downtimes thanks to longer sensor service life, even in harsh working conditions
- Quick and easy installation thanks to optical adjustment indicator and self-locking nuts
- High degree of flexibility and communication options thanks to IO-Link
- Easy to implement customer-specific variants within the standard product portfolio

THE ECONOMIC STANDARD FOR USE IN THE FOOD INDUSTRY

Product description

The IMF inductive proximity sensor is the new standard for reliability in the food industry. With its extended sensing ranges, made highly precise thanks to the use of SICK ASIC technology, the IMF ensures reliable, stable processes. What's more, its wide-ranging specification limits allow the IMF to be used in all areas of food production: a huge benefit when it comes to product selection and

warehousing. The optical adjustment indicator saves time during commissioning and helps cut down on errors. Communication via IO-Link is also possible, creating more flexibility and adding more functions for automation applications. With an extensive standard product portfolio available, even special devices can be put into action quickly and easily.

At a glance

- Types: M8 to M30
- Extended sensing ranges: 2 mm to 20 mm
- Electrical configuration: DC 3- and 4-wire
- Enclosure rating: IP 68, IP 69K
- Temperature range: -40 °C to +100 °C
- Food-compatible stainless-steel housing, plastic sensing face
- Optical adjustment indicator, IO-Link-ready
- Resistant to industrial cleaning agents, Ecolab-certified

Your benefits

- Reliable processes thanks to extended, highly accurate sensing ranges enabled through the use of SICK ASIC technology
- Reduced machine downtimes thanks to a longer service life, even when subjected to frequent cleaning cycles
- Quick and easy installation thanks to the optical adjustment indicator
- High degree of flexibility and communication options thanks to IO-Link
- Easy to implement customer-specific variants thanks to a modular concept

C

ROBUST FULL METAL SENSORS FOR USE IN THE FOOD INDUSTRY

Product description

High-pressure cleaners with aggressive cleaning agents, acids, and alkalis are a challenge for sensor systems. The solution: IMI inductive proximity sensors in fully encapsulated sensor

housings made from stainless steel (316L/1.4404). These sensors can withstand extreme stress, offer triple the sensing range and maximum performance.

At a glance

- Types: M8 to M30
- Triple sensing ranges: 6 mm to 40 mm
- Electrical configuration: DC 3-wire
- Enclosure rating: IP 68, IP 69K
- Temperature range: -25 °C to +85 °C
- Food-compatible stainless-steel housing, stainless steel sensing face
- Sensing face made of food-compatible stainless steel
- Resistant against cleaning agents

Your benefits

- Higher machine availability due to rugged sensor design
- Long service life even under the most extreme ambient conditions
- Quick and easy installation due to adjustment indicator
- Large operating reserves due to threefold sensing range
- High resistance to shock and vibration due to stainless steel sensing face
- Best resistance against cleaning agents
- Longer service life for reduced costs

Product description

Safe detection in ATEX areas. The IMN sensors are available for this due to their high quality and reliability. No

whether in category 1G or 2G, the NAMUR sensors from SICK are perfectly suited for explosion-hazardous areas.

At a glance

- Types: M8 to M30
- Sensing ranges: 1 mm to 15 mm
- NAMUR according to DIN EN 60947-5-6
- Enclosure rating: IP 67
- Temperature range: -20 °C to +70 °C
- Nickel-plated brass housing; plastic sensing face
- ATEX device category 1G and 2G
- Suitable for applications in explosion-hazardous areas

Your benefits

- Exceptional protection in explosive areas
- Category 1G and 2G for zones 0 and 1
- Output according to DIN EN 60947-5-6

Accessories	C-127

Product description

The IMA inductive analog sensors give out a current or voltage signal which is in proportional relation to the distance from the sensor to the metal target. They are therefore optimally suited for monitoring travel paths, positions or

even differentiating between spaces and material variants. These sensors are characterized by extremely large detection ranges up to 40 mm, high accuracy, precision and no blind areas.

At a glance

- Types: M8 to M30
- Extended detection ranges: 0 mm to 40 mm
- Analog output signal 0 V ... 10 V and 4 mA ... 20 mA
- Enclosure rating: IP 67
- Temperature range: -25 °C to +75 °C
- Nickel-plated brass housing; plastic sensing face
- High resolution and repeatability
- Distance control and continuous position detection

Your benefits

- High positioning accuracy
- No mechanical add-on parts required for monitoring of great distances
- Less space required for the same sensing range when compared with standard sensors
- Less storage due to reduced multiplicity of types on account of integrated current and voltage interface
- Large detection areas

HIGH-PRESSURE-RESISTANT SENSORS FOR HYDRAULIC APPLICATIONS

Product description

The inductive, high-pressure-resistant IMP sensors are perfectly suited for the query of end positions in hydraulic cylinders. The use of state-of-the-art ASIC and manufacturing technologies from SICK sets new standards in installation size, service life and load capability for the sensors. Due to the stable

stainless steel housing and an active high-performance ceramic surface, they are pressure-resistant up to 500 bar. Above-average system throughput is a matter of course for the range of models M5, M8, M12 and M14 thanks to 1 million tested pressure cycles.

At a glance

- Types: M5, M8, M12 and M14
- Extended sensing ranges: 1 mm to 3 mm
- Electrical configuration: DC 3-/4-wire
- Enclosure rating: IP 68
- Temperature range: -25 °C to +100 °C
- Stainless steel housing with active surface made from stable high-performance ceramic
- Pressure resistant up to 500 bar, gas-tight front
- Expected service life of up to 1 million pressure cycles

Your benefits

- Reduced maintenance costs
- Extremely resilient and durable
- Up to 50 times longer service life compared to conventional sensors under pressure cycles
- Simple compensation of cylinder tolerances
- Simple integration due to small design
- Controlled piston deceleration
- Increased piston service life due to collision prevention at the end of the work cycle

Product description

The SAM sensor is the simple and intelligent way of speed monitoring with an additional IO-Link interface. SAM can be used as a classic speed monitor or innovative acceleration monitor with a revolutionary speed-independent monitoring function. It checks if an adjustable speed or acceleration threshold is

crossed and provides a switching signal. SAM is setting new standards and revolutionizing commissioning tasks and fields of application thanks to its fast response time, monitored range of up to 12,000 pulses per minute and intelligent start-up delay.

At a glance

- Types: M18 and M30
- Sensing ranges of up to 10 mm flush
- Speed and acceleration monitoring
- Monitoring range: 6 to 12,000 pulses/min. and 0.1 to 2 pulses/sec.²
- Switching and pulse output
- Intelligent start-up delay

- Speed monitoring can be flexibly configured via two thresholds
- Flexible sensor settings, monitoring, extended diagnostics, and visualization thanks to IO-Link

Your benefits

- Speed-independent detection of speed changes
- Faster detection of speed changes than conventional speed monitors
- No readjustment after speed changes necessary
- Precise and convenient configuration via software
- IO-Link provides easy data access from the PLC

- No time-consuming, individual configuration of start-up delay feature necessary
- Reliable output signal thanks to adjustable speed thresholds (hysteresis)
- No expensive counter cards necessary in PLC

Installation note

Flush installation

	Sensing range Sn	Installation type	A	B	C	D	E	F
IMC18	7 mm	Flush	-	18 mm	18 mm	18 mm	-	56 mm
IMC30	10 mm	Flush	-	30 mm	30 mm	30 mm	-	80 mm

Speed monitoring

Switching signal is activated when the upper speed threshold set for the pulse sequence is exceeded.

- ① Connection
- ② Indication LED
- ③ Fastening nuts (2x); width across 24, metal

Acceleration monitoring

Switching signal is activated when the acceleration threshold set for the change in pulse sequences is exceeded.

Start-up delay

The start-up delay is activated when the operating voltage is applied.

Off:

Start-up delay is not active.

Time delay:

The start-up delay activates the switching output for a time delay within a programmable range from 0 to 254 s.

Upper limit:

The start-up delay activates the switching output until the upper speed threshold is reached.

Limit values

Upper speed limit:

Switching output Q is activated when the upper threshold value is exceeded. The lower threshold value can range from 6 to 12,000 pulses/min.

Lower speed limit:

Switching output Q is activated when the deceleration value is exceeded. The lower threshold value can range from 6 to 12,000 pulses/min.

Acceleration:

Switching output Q is activated when the deceleration value is exceeded. The deceleration value can range from 0.1 to 2 pulses/min.

Accessories	C-145

Product description

The IQM sensors with their rectangular miniature designs are real space-savers. Thanks to the low heights of a minimum of 4.7 mm and fully-integrated electronics, they set new standards and contribute to the miniaturization of modules

At a glance

- Types: 8 mm x 16 mm x 4 mm or 10 mm x 30 mm x 6 mm
- Extended sensing ranges: 1.5 mm to 3 mm
- Electrical configuration: DC 3-wire
- Enclosure rating: IP 67
- Temperature range: -20 °C to +70 °C
- Plastic housing
- Flat, space-saving and light design

Your benefits

- Easy installation in applications with limited available space
- Reliable detection of fast handling and mounting processes
- High positioning accuracy and precise switching behavior
- Great freedom with respect to machine design thanks to the lower height
- Low weight enables fast acceleration in dynamic handling processes
- Quick and reliable mounting with just one screw

Product description

With slim dimensions of just 5 mm x 5 mm or 8 mm x 8 mm, the IQY sensors offer up to 4 mm in sensing range, thereby providing the best performance while taking up the least possible space. Integration into linear units or confined installation spaces is no problem. State-of-the-art SICK-ASIC technology and an

output state display that is visible from all angles makes a simple solution for modern handling and automation tasks, ensuring the highest levels of production reliability. No matter whether in VISTAL™ or metal housing, the sensors of the IQY product family rise to every challenge with ease.

At a glance

- Types: 5 mm x 5 mm x 25 mm or 8 mm x 8 mm x 40 mm
- Extended sensing ranges: 0.8 mm to 4 mm
- Electrical configuration: DC 3-wire
- Enclosure rating: IP 67 or IP 68
- Temperature range: -25 °C to +75 °C
- Tough VISTAL™ housing
- Thin version with 270° output state display

Your benefits

- Easy integration in space-critical applications
- Reliable detection of fast handling and mounting processes
- Quick and easy mounting
- Thin housing provides a high degree of design freedom

Product description

Compact design with best-in-class performance. The IQB sensors offer extended sensing ranges of up to 8 mm and state-of-the-art SICK-ASIC technology. Its proven, reliable design with 270° status display is also ideal for more demanding applications. Extremely rugged

VISTAL™ housing, innovative hotmelt molding and an IP 68 enclosure rating make the sensors of the IQB product family the first choice for a wide range of applications and ensure the highest possible levels of process reliability and satisfaction.

At a glance

- Types: 10 mm x 16 mm x 28 mm or 12 mm x 26 mm x 40 mm
- Extended sensing ranges: 2 mm to 8 mm
- Electrical configuration: DC 3-/4-wire
- Enclosure rating: IP 68
- Temperature range: -25 °C to +75 °C
- Tough VISTAL™ housing
- Small version with 270° output state display

Your benefits

- Best mechanical and electronic stability for extra-long service life
- Highest levels of process reliability for your application
- Long service life that reduce maintenance costs thanks to SICK's ASIC technology and rugged VISTAL™ housing
- Precise detection and high sensor accuracy enable fast handling and assembly processes
- Space-saving integration in every application
- High resistance to shock and vibrations reduces maintenance costs
- Quick viewing of sensor status from any position in the room reduces maintenance costs
- Safe, fast mounting without any need for readjustment saves installation time and maintenance costs

Product description

When space is tight, the flat design of the IQV sensors are the best choice. Thanks to a low height, they can be easily integrated into applications where space is critical and allow a high degree of freedom when it comes to machine

design. Greater sensing ranges of up to 7 mm simplify even the trickiest of detection tasks. Not only the robust metal housing, but also the high tightening torque make flat designs the favorite of installers.

At a glance

- Types: 20 mm x 32 mm x 8 mm or 25 mm x 50 mm x 10 mm
- Extended sensing ranges: 5 mm to 7 mm
- Electrical configuration: DC 3-/4-wire
- Enclosure rating: IP 67
- Temperature range: -25 °C to +70 °C
- Metal housing, plastic sensing face
- Flat housing made of robust metal

Your benefits

- Extremely stable and durable
- For applications with limited space
- No restrictions on machine design
- Flat housing provides a high degree of design freedom
- Reliable mounting with high tightening torque

COMPACT RECTANGULAR HOUSINGS FOR USE IN HARSH AMBIENT CONDITIONS

Product description

The IQG sensors can be mounted in a matter of seconds, offer flexible adjustment options, and are easy to monitor. The innovative push-lock system enables mounting without tools in one second flat and makes replacing sensors child's play. Thanks to the rotating sensor head, the IQG sensors can be adapted to suit a whole range of applications. The four corner LEDs enable

straightforward sensor status monitoring, whatever the mounting position. A high ambient temperature range, high shock and vibration resistance and good electromagnetic compatibility enable the IQG product family sensors to work continuously and reliably in very harsh environments with strong atmospheric influences.

At a glance

- Type: 40 mm x 40 mm
- Extended sensing ranges: 15 mm to 40 mm
- Electrical configuration: DC 3-/4-wire
- Enclosure rating: IP 68, IP 69K
- Temperature range: -25 °C to +85 °C
- Plastic housing
- Push-lock mounting system
- Sensor head can be rotated in five directions

Your benefits

- Easy to mount in only two seconds without the need for additional tools
- Reliable, cost-effective detection
- The four corner LEDs ensure that the sensor status can be identified from any viewing direction, whatever the mounting position
- Can be easily adapted to numerous applications
- Long sensor service life, even in harsh environments that are subjected to severe weather conditions
- Stable processes thanks to extensive sensing ranges

LARGE RECTANGULAR HOUSINGS FOR USE IN INDUSTRIAL ENVIRONMENTS

Product description

With an adjustable sensing range of up to 60 mm, the sensors of the IQL product family offer a high degree of detection ease. Thanks to the freely configurable N/O and N/C output function, they also reduce costs in new and existing applications. Due to installation

from above and the extended sensing range, the IQL sensors are optimally suited for recessed floor mounting, as is often found in the automotive industry or storage and conveyor technology. The IQL is also the number one choice when it comes to other applications.

At a glance

- Type: 80 mm x 80 mm
- Longer sensing ranges: 50 mm to 60 mm
- Electrical configuration: DC 3-/4-wire, or AC/DC 2-wire
- Enclosure rating IP 65 or IP 67
- Temperature range: -25 °C to +80 °C
- Plastic housing
- Programmable N/O or N/C function
- Sensing range setting via potentiometer

Your benefits

- Increase in machine availability
- Reduced mechanical damage
- Longer service life for reduced costs
- Quick and safe installation

INDUCTIVE SAFETY SWITCHES

Safe, non-contact position monitoring

Inductive safety switches are used for determining position and work on a non-contact basis. They detect approaching objects without a separate actuator. Their wide response range makes them simple to mount and adjust.

Your benefits

- Long service life due to durable and low-maintenance design
- Just one safety switch in conjunction with a suitable safety module makes it possible to solve applications up to PL e and Cat. 4 (EN ISO 13849)
- The devices are easy to clean, making them suitable for contaminated areas or environments with strict hygiene standard
- Fast diagnostics via LED status indicator
- Flexi Loop now enables a safe series connection with enhanced diagnostics capabilities and minimal wiring effort.

Product description

The IN3000 Direct inductive safety switches are used for determining position and work on a non-contact basis. These safety switches are actuated through metal (e.g., ST37 steel) so that no separate actuator is required. The IN3000 Direct can be connected

via two outputs directly to a suitable electronic evaluation system, such as a safe control solution. Their non-contact operating principle enables simple adjustment and mounting as well as providing increased shock and vibration resistance.

At a glance

- Response range of up to 15 mm
- LED status indicator
- Up to performance level PL d (EN ISO 13849), SILCL2 (EN 62061), SIL2 (IEC 61508)
- Flexi Loop-compatible M12 plug connector

Your benefits

- Cost-effective solution for applications up to PL d / SILCL2
- Space-saving mounting due to compact housing design
- Fast diagnostics via LED status indicator
- Long service life due to durable and low-maintenance design
- The devices are easy to clean, making them suitable for contaminated areas or environments with strict hygiene standards
- Flexi Loop now enables a safe series connection with enhanced diagnostics capabilities and minimal wiring effort.

SAFE, NON-CONTACT POSITION MONITORING

Product description

The IN4000 Direct inductive safety switches are used for determining position and work on a non-contact basis. These safety switches are actuated through metal (e.g., ST37 steel) so that no separate actuator is required. The IN4000 Direct has two safety outputs

(OSSD) and can be connected directly to a suitable safety-enhanced electronic evaluation system, such as a safe control solution. Their non-contact operating principle enables simple adjustment and mounting as well as providing increased shock and vibration resistance.

At a glance

- Two OSSD safety outputs for direct connection of sensors to a single safety controller
- Response range of up to 20 mm
- LED status indicator
- Up to performance level PL e / Cat. 4 (EN ISO 13849)
- Flexi Loop-compatible M12 plug connector

Your benefits

- Direct connection to the safe control solution eliminates any additional wiring and reduces installation time
- Fast diagnostics via LED status indicator
- Long service life due to durable and low-maintenance design
- Just one safety switch in conjunction with a suitable safety module makes it possible to solve applications up to PL e and Cat. 4 (EN ISO 13849)
- The devices are easy to clean, making them suitable for contaminated areas or environments with strict hygiene standards
- Flexi Loop now enables a safe series connection with enhanced diagnostics capabilities and minimal wiring effort.

Product description

The IN4000 Standard inductive safety switches are used for determining position and work on a non-contact basis. These safety switches are actuated through metal (e.g., ST37 steel) so that no separate actuator is required. It has a single-channel operating principle: a pulsed input signal is converted to a pulsed output signal and evaluated by

the connected safety controller. The response time of the sensors is monitored spatially and chronologically, enabling better prevention against tampering and a high level of safety protection. Their non-contact operating principle enables simple adjustment and mounting as well as providing increased shock and vibration resistance.

At a glance

- One clocked safety output for direct connection of sensors to a safety controller
- IP67 or IP69K enclosure rating
- Response range up to 15 mm
- LED status indicator
- Up to performance level PL e (EN ISO 13849)
- Safe series connection of sensors possible

Your benefits

- Fast diagnostics via LED status indicator
- Cascadability of up to 9 sensors saves costs
- Long service life due to durable and low-maintenance design
- Just one safety switch in conjunction with a suitable safety module makes it possible to solve applications up to PL e and Cat. 4 (EN ISO 13849)
- The devices are easy to clean, making them suitable for contaminated areas or environments with strict hygiene standards

D

CAPACITIVE PROXIMITY SENSORS

E

Detection of metallic and non-metallic objects

Sometimes you need to know what is hidden beneath a surface. Behind a wall, for example, inside a storage container, inside a shipping container, or behind a cover. Capacitive proximity sensors are ideal for level and feed monitoring. From solid material, such as paper or wood, to granules or liquids, they can be relied upon to detect what is happening in the production process

and during final inspection. Is there something behind that cover? Is the finished package really full? How much paint is still left in the tank? For capacitive proximity sensors, these are easy questions to answer. SICK's capacitive proximity sensors are never far from the action. Sensing ranges between 1 and 25 mm allow them to be used in nearly all installation situations, making them

extremely adaptable for a wide range of applications. These sensors are also remarkably resistant to interference. Impurities, contamination, dust, and airborne spray particles have little effect on them, nor does electromagnetic interference. No wonder they are installed in a wide range of industries, such as food and automotive, or in storage and conveyor systems.

They see through it all

Capacitive sensors from SICK are a compact, user-friendly, and operationally safe solution for object detection and level monitoring – perfectly suited to taking on an incredibly wide range of applications.

“No can do?” No way.

There is virtually nothing that a capacitive sensor can't detect: Wood, glass, metals, or plastics – regardless of whether the materials are solid, powdery, granular or fluid, conducting or non-conducting. Extremely compact, there is always space for this sensor, which guarantees a reliable signal even in severely contaminated environments. And all this from the other side of a wall – totally non-contact and wear-free.

TRIED-AND-TESTED SENSORS FOR OBJECT DETECTION AND FILL LEVEL DETECTION

Product description

Capacitive proximity sensors can detect all powdery, granulated, liquid, and solid materials – even through plastic or glass walls.

SICK's capacitive proximity sensors feature extremely high electromagnetic compatibility (EMC), which prevents false switches and sensor failure.

At a glance

- Cylindrical housing in M12, M18, and M30 models
- Detects powders, granulates, liquids, and solids
- High electromagnetic compatibility
- Electrical configuration: DC 2 and 4-wire
- Supply voltage: 10 V DC to 36 V DC
- Optical adjustment indicator
- Sensing ranges of up to 25 mm
- Enclosure rating: IP 65, IP 68, IP 69K

Your benefits

- Even functions reliable in harsh industrial environments, which reduces machine maintenance costs and downtimes
- Quick and easy adjustment can be made via the potentiometer or teach button to save valuable time during commissioning
- Highly flexible range of applications thanks to compact housing and universal mounting systems
- High shock and vibration resistance and minimal sensitivity to dust and moisture ensure reliable object detection and reduce machine maintenance costs
- Optical adjustment indicator ensures reliable object detection to minimize potential machine failures

SENSORS IN CYLINDRICAL PTFE-HOUSING THAT WITHSTAND TOUGH ENVIRONMENTS

Product description

Capacitive proximity sensors can detect all types of material: powder-based, granulated, liquid, and solid. The CM18 PTFE is ideal for detecting the level of acids, alkalis, or solvents, for example. It is also used for detection in

aggressive environments (acid fumes). PTFE-housing is resistant to almost all chemicals and organic solvents. FDA compliant material (PTFE) allows the use in the food and beverage industry.

At a glance

- M18 - metric housing
- Detects powders, granulates, liquids, and solids
- Extremely high electromagnetic compatibility
- Electric version: DC, 4-conductor
- Supply voltage: 10 V ... 36 V DC
- Short-circuit protection (pulsed)
- Housing material made from PTFE
- IP 67 protection class

Your benefits

- Lower maintenance costs due to a durable PTFE housing that withstands harsh ambient conditions
- Quick and easy adjustment via potentiometer saves installation and setup time
- Straightforward and safe sensor technology as an alternative to photoelectric and inductive sensors in applications such as detecting a product in a sealed box, container, or tank
- High electromagnetic compatibility prevents incorrect switching, thus increasing machine availability
- High shock and vibration resistance increases sensor life and reduces machine maintenance costs

RELIABLE CAPACITIVE PROXIMITY SENSORS ENCLOSED IN A RECTANGULAR HOUSING

Product description

Capacitive proximity sensors can detect all types of material: powder-based, granulated, liquid, and solid – even through plastic walls. SICK's capacitive proximity sensors also feature high elec-

tromagnetic compatibility (EMC), which prevents incorrect switching. CQ sensors feature rectangular housings that are suitable for all manner of installation conditions.

At a glance

- Rectangular housing
- Detects powders, granulates, liquids, and solids
- Extremely high electromagnetic compatibility
- Electric version: DC, 4-conductor
- Supply voltage: 10 V ... 36 V DC
- Short-circuit protection (pulsed)

Your benefits

- Non-contact level measurement, even through container or tank walls, which eliminates drilling holes and thus reduces installation time
- Durable housing withstands harsh industrial applications, reducing maintenance costs
- Quick and easy adjustment of the switching point - via pushbutton, remote teach for the CQ28 and via potentiometer for CQ35 and CQ4 - saves time

MAGNETIC PROXIMITY SENSORS

Magnetic proximity sensors with maximum operating distances and a minimal design

SICK offers an extensive portfolio of magnetic proximity sensors in metric (MM) and rectangular (MQ) configurations. Magnetic proximity sensors provide long sensing ranges that can reliably detect magnetic objects, with entirely new application options opened

up due to the smaller magnets. MM sensors in NAMUR design for the use in explosion-hazardous areas complete this comprehensive product family. MQ sensors offer all the advantages of a magnetic proximity sensor in a compact plastic housing. Magnetic proximity sen-

sors are designed specifically for use in harsh environments and are unaffected by dust, heat, or vibrations. Typical fields of application are also those where other sensors reach the limits of their technology.

MAGNETIC PROXIMITY SENSORS IN COMMON M8, M12, AND M18 CYLINDRICAL HOUSING

Product description

MM magnetic proximity sensors provide long sensing ranges that can reliably detect magnetic objects. Magnetic proximity sensors are resistant to dust, heat, vibrations and other harsh environ-

ments. The MM magnetic sensors are enclosed in a cylindrical housing and are available in sizes MM08, MM12 and MM18.

At a glance

- Types: M8 to M18
- Sensing range: up to 120 mm
- Electrical configuration: DC 3-wire
- Enclosure rating: IP 67
- Temperature range: -25 °C to +75 °C
- Nickel-plated brass housing; plastic sensing face
- Reliable detection of permanent magnets through non-ferromagnetic materials such as stainless steel, aluminum, plastic or wood
- Solves high-temperature applications by installing the permanent magnet in the high-temperature area and the sensor behind an insulated area

Your benefits

- Non-contact operation eliminates interference from dirt, dust and vibrations, increasing sensor life and reducing maintenance costs
- Space-saving installation due to small design
- Large operating ranges with reliable switching increase throughput
- Non-contact, universal detection through several substances, including plastic containers and pipes protective PTFE walls and non-magnetic metal walls

Installation notes

Flush sensor installation

Magnetic proximity sensors can be installed flush in all materials and metals with affecting the sensing range with the exception of magnetizable materials.

Non-flush sensor installation

The table shows how much the proximity sensor must protrude when installed in magnetic materials to prevent a reduction in the sensing range by more than 5%. Measurement standard MAG-3010-B (M 4.0).

NAMUR MAGNETIC PROXIMITY SENSORS IN A CYLINDRICAL HOUSING FOR EXPLOSIVE AREAS

Product description

MM NAMUR magnetic proximity sensors provide large operating distances that can reliably detect magnetic objects. Magnetic proximity sensors are resistant to dust, heat and vibration, making them ideal for use in harsh environments –

even highly explosive atmospheres. By using magnetic conductors, these sensors are able to reliably detect objects over greater distances. The NAMUR design for hazardous areas is available in MM12 and MM18 designs.

At a glance

- Types: M12 to M18
- Sensing range: up to 120 mm
- Electrical configuration: NAMUR
- Enclosure rating: IP 67
- Temperature range: -25 °C to +70 °C
- Nickel-plated brass housing; plastic sensing face
- Reliable detection of permanent magnets through non-ferromagnetic materials such as stainless steel, aluminum, plastic or wood
- NAMUR design for usage in explosion-hazardous areas

Your benefits

- NAMUR version ensures safe function in explosion-hazardous areas
- Non-contact operation eliminates interference from dirt, dust and vibrations, increasing sensor life and reducing maintenance costs
- Large sensing ranges ensure reliable switching, even with target position tolerances
- Universal use since detection through other objects, such as plastic walls or non-magnetic stainless steel walls, is also possible

Product description

The MQ magnetic proximity sensors reliably detect permanent magnets through non-magnetic materials such as stainless steel, aluminum, plastic or wood. The MQ sensors feature a square,

compact plastic housing that makes them easy to install. These sensors are resistant to dust, heat and vibration, making them ideal for use in harsh environments.

At a glance

- Type: 10 mm x 28 mm x 16 mm
- Sensing ranges: up to 60 mm
- Electrical configuration: DC, 3-wire
- Enclosure rating: IP 67, IP 68
- Temperature range: -25 °C to +75 °C
- Tough VISTAL™ housing
- Reliable detection of permanent magnets through non-ferromagnetic materials such as stainless steel, aluminum, plastic or wood
- Solves high-temperature applications by installing the permanent magnet in the high-temperature area and the sensor behind an insulated area

Your benefits

- Short-circuit protection (pulsed)
- Large sensing ranges ensure reliable switching, even with target position tolerances
- Low-cost sensor solution saves installation time and costs
- Compact plastic housing makes machine integration easy

YOUR ORDER, PLEASE! CUSTOMIZABLE SOLUTIONS TO FIT YOUR NEEDS.

If you don't find the proximity sensor in the SICK portfolio that meets your requirements, we can develop a sensor based on your specifications that fits your application.

G

Even with a wide range of standard offerings for proximity sensors, individual and customized solutions are sometimes required to meet the specific requirements and application conditions in the automation industry. The dialog with our specialists for customized development begins here.

Whether small, but crucial adaptations to our standard components or comprehensive developments are required, our experts will find the optimal solution. We guarantee a structured project workflow from the start.

TAILORED SOLUTIONS

Design to implementation of a tailored solution is divided into three areas and six phases. During each phase of the project, you can rely on our support and expertise – anywhere in the world.

G

CUSTOMIZABLE SOLUTIONS TO FIT YOUR NEEDS

SICK is on your side as an innovative, reliable and competent partner in evaluating and assessing all application requirements. After determining the necessary the necessary product adjustments, we define the specification for your customized solution in collaboration with you.

Compile your “wish list” from the following components:

● CONNECTION

- M5
- M8
- M12
- Special connector

● HOUSING

- Form and design
- Dimensions
- Material
- Integrated assembly concept

● ACTIVE AREA

- Sensing range
- Hysteresis
- Switch on delay
- Temperature range

● CABLE

- Length
- Material
- Special features (e.g., oil resistant)

● ELECTRONICS

- Output type (NPN/PNP)
- 2-, 3- and 4-wire
- Normally open / normally closed
- Intelligent switching

● ONSITE MOUNTING

- Customized mounting concept for quick and easy installation of the sensor onsite

Your contacts at SICK are happy to advise you.

ACCESSORIES

Perfect sensor integration made easy

Innovative sensor technology is only one side of the coin when talking about intelligent automation solutions. The picture is completed by matching accessories for professional and cost-effective integration. Whether electrical connection technology or mechanical mounting systems, only the right integrative system products lead to a high quality,

highly available application solution. The advantage? Sensors and accessories work in conjunction to offer maximum operational safety.

In addition, the user is able to save additional costs for development, manufacture and procurement. A wide range of accessory components are always available on short-notice – convenient

single-source availability in combination with sensors. And in the event that a custom solution is required, SICK is on your side as a reliable and competent partner. Tailored developments and adaptations can be implemented in just a short period of time.

MOUNTING SYSTEMS AND CONNECTIVITY

Mounting systems

To integrate SICK sensors perfectly into a machine or system, mounting equipment tailored precisely to the sensors is required. Whether fine adjustment to precision equipment or protection against harsh environmental conditions, SICK provides matching designs and products for mounting, alignment, and protection for its sensors. When it comes to special applications, SICK works with the customer to develop tailored and system-specific mounting elements, which are then delivered with the sensor.

Your benefits

- Quick system installation and maintenance thanks to a broad portfolio of simple, practical mounting options tailored to SICK sensors
- Flexible, customized alignment of the sensor to the object being detected using the universal clamp system
- Prevention of sensor damage (e.g. due to mechanical loads) and guarantee of sensor functionality with the aid of SICK sensor protection solutions
- Application-specific solutions for mounting, aligning, and protecting sensors

Passive connectivity

A broad portfolio of termination screw male and female connectors allows customized wiring solutions to be implemented. Depending on the requirements, SICK offers different lengths of cable and materials that are delivered quickly and pre-assembled free of errors. Connecting cables (with a molded round connector at one end and open at the other end) offer maximum flexibility when wiring sensors.

Your benefits

- Operational safety because the connectivity is designed for the sensors
- Low costs thanks to high-quality components with long service lives
- Guaranteed productivity thanks to reliable detection
- Ready to assemble plug connectors with screw connection or insulation piercing
- Broad portfolio of connecting and extension cables with PUR jacket (high resistance to oils, lubricants, and coolants), PVC jacket (good resistance to chemicals for use in dry zones), and for use in hygienic and washdown zones (maximum resistance to chemicals, acids, alkalis, and cleaning agents)

PROXIMITY SENSOR TECHNOLOGY IN DETAIL

Depending on which object material is to be detected or which special application is to be solved, different proximity sensor technology is used. The sensing range taking into account a possible reduction factor is decisive for selecting the best sensor from the product family group.

Sensing range

The sensing range S_n of a proximity sensor is the distance at which a signal change is triggered when the target, i.e., the object to be detected, approaches the sensing face axially.

In order to get comparable values for the sensing range of the proximity sensors, the standard target was defined for metallic material made of steel or oxide magnet. In the technical data of the proximity sensors from SICK, this value is always specified. It does not account for external influences or sample variances.

	Inductive/capacitive	Magnetic
Material	St37 (steel)	Oxide magnet (barium ferrite)
Dimension	1 mm thick (square)	Ø 30 mm x 10 mm high (M4.0, round)
	Side length = Sensing face diameter or $3 \times S_n$ ¹⁾	

¹⁾ The larger of the two values indicates the side length of the standard target.

The sensing range S_n specified in the technical data does not account for external influences or sample variances and therefore, is only a conventional size.

Depending on the selected sensor principle, different tolerance ranges are possible, in which the actual measured sensing range of the sensors can vary.

Tolerance ranges

Inductive and magnetic proximity sensors

► $0.81 \times S_n < \text{tolerance range} < 1.21 \times S_n$

Capacitive proximity sensors

► $0.72 \times S_n < \text{tolerance range} < 1.32 \times S_n$

In practice, the **assured sensing range S_a** is always used in designing a sensor to ensure switching in consideration of all tolerance influences and to operate the sensor in an assured working range.

Assured sensing range S_a

The distance at which a response from the proximity sensor is ensured under the specified temperature, installation and voltage conditions.

Formula for calculating assured sensing range S_a

Inductive and magnetic proximity sensors

$$\blacktriangleright S_a = 0.81 \times S_n$$

Capacitive proximity sensors

$$\blacktriangleright S_a = 0.72 \times S_n$$

Reduction factor

If an object is detected from another material made of steel or oxide magnet, the sensing range is reduced. The reduction is expressed with reduction factor R_m . Therefore, additional standard values for the reduction factor are specified in the technical data.

Inductive

Material	Reduction factor R_m
Steel (St37)	1
Stainless steel	0.65 ... 0.9 ¹⁾
Aluminum	0.2 ... 0.5 ¹⁾

¹⁾ Depending on the sensor.

Capacitive

Material	Reduction factor R_m
Water	1
PVC	0.4
Oil	0.25

Magnetic

Magnet	Reduction factor R_m
M5.0	1.1 ... 1.2 ¹⁾
M4.0	1
M1.0	0.25 ... 0.38 ¹⁾

¹⁾ Depending on the sensor.

Example calculation of the assured working range for inductive and magnetic proximity sensors:

Material	Aluminum ($R_m = 0.5$)
Sensing range S_n	20 mm
$S_a = 0.81 \times S_n = 0.81 \times 20 \text{ mm} = 16.2 \text{ mm}$	
Assured working range = $R_m \times S_a = 0.5 \times 16.2 \text{ mm} = 8.1 \text{ mm}$	
► The assured working range is 8.1 mm.	

Example calculation of the assured working range for capacitive proximity sensors:

Material	PVC ($R_m = 0.4$)
Sensing range S_n	10 mm
$S_a = 0.72 \times S_n = 0.72 \times 10 \text{ mm} = 7.2 \text{ mm}$	
Assured working range = $R_m \times S_a = 0.4 \times 7.2 \text{ mm} = 2.88 \text{ mm}$	
► The assured working range is 2.88 mm.	

More definitions for the proximity sensor technologies can be found in

→ **Chapter J – Appendix/Glossary**

INDUCTIVE PROXIMITY SENSOR TECHNOLOGY

Technology and principle of operation

An inductive proximity sensor consists of an LC circuit – i.e., a resonant electrical circuit comprising a coil (L) and a capacitor (C) – a signal evaluator and a switching amplifier.

Inductive proximity sensors can take two output states, which are described as activated and deactivated. To detect metallic objects, the coil of the resonant circuit generates a high frequency electromagnetic alternating field that emerges from the sensing face of the sensor. The size of the field is defined by the size of the ferrite core and the coil.

If an activated material approaches the sensing face, non-ferrous metal eddy currents are generated. In ferromagnetic metals, there are additional core losses. These losses deprive the resonant circuit of energy and dampen the oscillation. The signal evaluator detects this change and translates this into a switching signal.

The inductive proximity technology is also an integral part of our inductive safety switches.

You can find capacitive proximity sensors in → **Chapter C and Chapter D**

CAPACITIVE PROXIMITY SENSOR TECHNOLOGY

Technology and principle of operation

For capacitive proximity sensors, the principle of an open capacitor is used. The sensor contains an active electrode from which an electrostatic field to earth (ground potential) develops. This capacitance is part of a resonant circuit and affects the fundamental vibration behavior.

If an object/medium finds itself in the electrical field, the vibration behavior of the resonant circuit changes (based on its dielectric properties) and there is a change in amplitude. The signal evaluator detects this change in amplitude, which has the switching amplifier give the signal to switch. The closer the object comes to the active electrode, the greater the change in capacitance.

Special features

Detecting all the way through the material

Wall thicknesses of 10 to 20 mm in the case of plastic or glass containers.

Harsh environment

Highly resistant to vibrations, dust, dirt, etc.

Detecting of all materials possible

Wood, paper, metal, plastic, liquids, granules.

Relatively large sensing ranges with a compact design

Up to $S_n = 25\text{ mm}$ (CM30/CQ35).

High electromagnetic and electrostatic compatibility

Thanks to Tripleshield technology.

Other technological features of the capacitive proximity sensors (e.g., the meaning and definition of dielectric constant ϵ_r) are described in → [Chapter J – Appendix/Glossary](#).

You can find capacitive proximity sensors in → [Chapter E](#)

MAGNETIC PROXIMITY SENSOR TECHNOLOGY

Technology and principle of operation

Magnetic proximity sensors always respond to a magnet (magnetic encoder). Magnetic fields penetrate all non-magnetic materials, e.g., non-ferrous metal, plastic or wooden

walls. Therefore, magnets can also detect through these walls without affecting the sensing range.

For the magnetic proximity sensors from SICK, two detection technologies are used.

GMR technology (Giant Magneto Resistive effect)

Resistors that change their ohmic value by magnetic fields are arranged in a Wheatstone bridge. When exposed to a magnet field, the bridge voltage increases. The signal evaluator generates an output signal from a defined threshold.

LC circuit technology

An LC circuit is pre-activated from a highly permeable, amorphous glass metal strip. It resonates with a small amplitude. If an external magnet field appears, the highly permeable (highly magnetically conductive) glass metal strip is brought into saturation. Activation of the LC circuit by the glass metal strip no longer occurs. The amplitude of the resonant circuit increases whereby a defined threshold is reached and an output signal generated. This technology is well suited for high sensing ranges ($S_n > 70$ mm with M4.0 magnet).

Special features

Approach curves

When using magnetic proximity sensors, make sure that the alignment of the magnet relative to the sensor axis changes the sensing range. A distinction is made between the following cases:

Sensor and magnet axes are in the same plane to each other

Case 1

The sensor responds when the magnet reaches the switch curve. It can approach the proximity sensor axially or pass within the sensing range in front of the sensor.

Case 2

The sensor responds when the magnet reaches the switch curve from the side. If the magnet leaves the switch curve, the sensor switches back again.

Sensor and magnet axes are offset by 90°

Case 3

If the magnet passes in front of the proximity sensor radially, the sensing range is less than in case 1. If the magnet travels into the left switch curve from the right switch curve, for example, it passes through an area in which the magnetic field is reversed. The proximity sensor is briefly deactivated before it is activated again in the left switch curve. Whether the evaluation unit can detect this interruption depends on the speed of travel and the axial distance of the passing magnet.

Case 4

The magnet also passes through two switch curves. At the boundary, the magnetic field is reversed and there are two switching points. The solubility of this interruption also depends on the speed of travel and the radial distance to the sensor axis.

Other technological features of the magnetic proximity sensors (e.g. the meaning and definition of overrun distance S_o or installation notes) are described in → „Chapter J – Appendix/Glossary“ on page J-292.

Installation notes

Flush sensor installation

Magnetic proximity sensors can be installed flush in all materials and metals with affecting the sensing range with the exception of magnetizable materials.

Non-flush sensor installation

The table shows how much the proximity sensor must protrude when installed in magnetic materials to prevent a reduction in the sensing range by more than 5%. Measurement standard MAG-3010-B (M 4.0).

Flush magnet installation

For flush installation of the magnets in magnetic materials, the sensing range is reduced by up to 60 %.

Object detection through surfaces

Because magnetic fields penetrate all non-magnetic materials, magnetic proximity sensors can detect objects/media behind e.g. non-ferrous metal, plastic or wooden walls.

You can find magnetic proximity sensors in → **Chapter F**

IMPORTANT INFORMATION ABOUT SICK SENSOR SOLUTIONS

From A for Adjustment indicators to W for Wire-break protection, the following pages contain explanations of key terminology in a concise, easy-to-read format. Definitions of all key terms related to innovations and proximity sensor solutions from SICK can be found here. This glossary also provides valuable information about directives and standards such as conformity, protection classes, electrical characteristics and much more.

Glossary	J-294
Explosion protection according to ATEX	J-302
Index	J-304

A

Adjustment indicators

The optical adjustment indicator enables fast adjustment of the sensors. The LED indicator flashes in the range 81 – 100 % of the nominal sensing range and in continuous display overflow when it reaches the assured sensing range (81 %).

Ambient temperature, operation/storage

The ambient temperature indicates the range within which the proximity sensor works properly.

Assured sensing range

The distance at which a response of the proximity sensor is ensured under the specified temperature, installation and voltage conditions.

ATEX Directive 94/5 EC

→ See „Explosion protection according to ATEX“ on page J-302

B

Bandwidth

The bandwidth describes the highest frequency for periodic sensor operation, where the output signal decreases by not more than 3 dB. Bandwidth is always measured at half sensing range ($\frac{1}{2} S_n$).

C

Coercivity H

The coercive field strength H is the required negative field strength in kA/m (or Oersted Oe) that is necessary to demagnetize a magnet. The higher the value, the better the demagnetization resistance. A distinction is made between BHC and JH0. The coercive field strength JH0 is important for all magnetic materials with small remanence and high coercive field strength (e.g. barium ferrite). JH0 results from the hysteresis loop.

Continuous current I_a

Constant current is defined as the maximum load current for continuous operation.

Current consumption

Power consumption refers to the current consumption of 3 and 4-wire sensors without a load being connected.

E

Electrical wiring

Example connection diagram DC 2-wire:

2-wire, N/O

Example connection diagram DC 3-wire:

3-wire PNP, N/O

3-wire, NPN, N/C

A proximity sensor with normally closed function is activated in the deactivated state (low resistance) and blocked in the activated state (high impedance).

Example connection diagram DC 4-wire:

4-wire, N/C / N/O

EMC

According to EU directive 2004/108/EC on electromagnetic compatibility, systems and components must satisfy certain properties in order to function smoothly in an electromagnetic environment.

Enable zone

The enable zone defines an area within which the presence of a specific object (e.g. a steel plate) is detected by the sensing face of the sensor and results in the outputs being enabled.

Enclosure rating

The IP enclosure rating indicates the extent of a device's protection against contact with impurities such as dust or water. The code starts with the letters IP (ingress protection) and is followed by the first digit, which is an ascending indicator of the degree of protection against contact and impurities, while the second digit is an indicator of protection against ingress of water:

- IP 65: Complete protection against dust and protection against water jets
- IP 67: Complete protection against dust and protection against water in 1 m of water for a period of 30 minutes at a constant room temperature
- IP 68: Freely definable
- IP 69K: Protection against high pressure cleaning according to EN 60529. Jet duration 30 s depending on jet angle 0 - 90° in 30° steps at a water pressure of 80 - 100 bar and a water temperature of 80 ± 5 °C.

→ See „Fig. Enclosure rating“ on page J-301

Equipment category

→ See „Explosion protection according to ATEX“ on page J-302

Equipment groups

→ See „Explosion protection according to ATEX“ on page J-302

EU-type examination certificate

→ See „Explosion protection according to ATEX“ on page J-302

Explosive groups

→ See „Explosion protection according to ATEX“ on page J-302

Explosive zone category

→ See „Explosion protection according to ATEX“ on page J-302

External teach-in

Allows the user to make the required settings via the control cable of the sensor.

H

Hysteresis

Hysteresis describes the difference between the activation and deactivation point of the sensor based on target's axial approach to the active sensor area. The hysteresis is defined as a percentage of the real S_r sensing range.

I

Ignition protection type

→ See „Explosion protection according to ATEX“ on page J-302

Installation in metal

Flush

Flush proximity sensors can be mounted with the sensing face flush in an activated material. Flush proximity sensors can also be installed non-flush.

Non-flush

A non-flush proximity sensor requires free space around the sensing face, in which there should be no activated material. The size of the space is type specific. The sensing range is greater than with flush versions.

Quasi-flush

A quasi-flush proximity sensor requires free space around the sensing face, in which there should be no activated material. The size of the space is type specific. Although these sensors look identical to flush sensors, they may not be completely incorporated in metal.

L

Lateral approach

Lowest operating current I_m

→ See „Minimum load current“ on page J-297

M

Magnetic alignment

Responds to magnet field lines that only act on the sensor through the front of the housing (axial axis).

Max. tightening torque

The maximum allowable force that can be used when turning of a thread without damaging the thread. For sensors with cylindrical design, it prevents overextending the sensor housing.

Minimum load current

Describes the smallest current which is required for self-supply of 2-wire sensors to function in the switched-on state.

N

NAMUR

Standardization association for measurement and control.

No load current

→ See „Current consumption“ on page J-294

Nominal sensitivity

→ See „Response sensitivity“ on page J-298

O

Off-state current

Describes the current flowing in the blocked state in the load circuit of the proximity sensor.

Output current

The current for analog devices, which is present at the output and varies depending on the distance (between target and sensor) (e.g. in a range of 4 - 20 mA).

Output function

Normally open

A proximity sensor's output with N/O function is energized when a target is detected, and de-energized when no target is detected.

Normally closed

A proximity sensor's output with N/C function is de-energized when a target is detected, and energized when no target is detected.

Complementary output

Both an N/O and N/C signal are available simultaneously to a proximity sensor with complementary function. In the deactivated state, pin 2 is activated (low) and pin 4 is blocked (high impedance). In the activated state, pin 2 is blocked (high impedance) and pin 4 is activated (low).

Programmable

A proximity sensor with programmable function can, depending on the type, provide N/O or N/C function and can sometimes even implement PNP or NPN outputs. The type of programming is dependent on the particular type of sensor and can be found in the operating instruction.

Output voltage

The voltage for analog devices, which is present at the output and varies depending on the distance (between target and sensor) (e.g. in a range of 0 - 10 V).

P

Power consumption, activated

→ See „NAMUR“ on page J-297

Power consumption, deactivated

→ See „NAMUR“ on page J-297

Power-up pulse protection

The power-up pulse protection is used to suppress missing pulses at the output in the time between application of the supply voltage and oscillation of the oscillator.

Protection class

Electrical equipment is classified in relation to existing safety measures for prevention of electric shocks. Protection classes are defined in DIN EN 61140. There are four protection classes ranging from “Basic insulation” (Class 0) to “Safety extra-low voltage (Class 1), double insulation (Class 2), safety transformer” (Class 3).

Links: Protection class 1; middle: Protection class 2; right: Protection class 3

R

Rated sensing range

→ See „Sensing range S_n “ on page J-298

Real sensing range S_r

The sensing range of an individual proximity switch that is measured at a specified voltage, defined installation conditions and a temperature of 23 ± 5 °C.

Reduction factor R_m

When using targets made of a material that does not meet the requirements of the standard target, the sensing range is reduced based on the material used. This behavior is described by the reduction factor.

Remanence B_r

The remanence B_r is specified in tesla (T) or millitesla (mT), in the CGS measuring system in gauss (G). The remanence is the remaining magnetization in a magnet or flux density, which has been magnetized in a closed circuit to saturation.

Repeatability

The repeatability describes the percentage deviation of the switching point. It is measured over a period of eight hours at an ambient temperature of 23 ± 5 °C, relative humidity up to 90 % and a fixed supply voltage of 24 V DC for DC devices or 230 V AC for AC devices.

The difference between any two measurements shall not exceed 10% of the real sensing range (S_r).

This definition applies only for sensors with switching output stage.

Reproducibility

→ See „Repeatability“ on page J-298

Residual ripple

Residual ripple is defined as the superimposed AC component (maximum allowable peak, expressed as a % of U_V) of the DC supply voltage (typically 10 %).

Resolution

The resolution describes the smallest possible change that can be detected by the sensor.

Response sensitivity

Represents the strength of the magnet field in mT (millitesla), which is necessary to activate the sensor. Sensors with high response sensitivity can detect even weak magnetic fields.

Reverse polarity protection

Reverse polarity protection is protection built into a proximity sensor against damage caused by mixing supply voltage connections.

S

Safe switch off distance S_{ar}

The distance from the sensing face of the sensor out of which the absence of a specific object is properly detected while taking into consideration all specified ambient conditions.

Sensing face

The sensing face of a proximity sensor is defined as the area covered by the sensing range. It is also the area over which the sensor responds to the approach of activated material through an output state change.

Sensing range S_n

The distance at which the sensing face axially approaching standard target triggers a signal change. Manufacturing deviations and external factors are not considered.

Sensing range S_r

→ See „Real sensing range S_r “ on page J-298

Shock resistance

According to IEC 60068-2-27

6 shocks (six separate tests) are executed in each direction along three mutually perpendicular axes:

Pulse shape: half sine

Acceleration: $\leq 30 \text{ g}$

Pulse duration: 11 ms

Short-circuit protection

Short-circuit protection protects against overload and a direct short circuit. After exceeding the trigger threshold, the output is disabled. Then it is periodically (pulsed) queried whether the short circuit persists. After eliminating the short-circuit, the output is switched on again.

Short-time withstand current

Describes the current, which can temporarily push the sensor in the load circuit, without the sensor being destroyed.

Supply voltage

The supply voltage describes the voltage range within which the proximity sensor works properly.

Switching frequencies

→ See „Switching sequence“ on page J-299

Switching output

A switching output is the output via which the output state of the sensor is digitally outputted.

NPN output

The negative potential is here connected to the load. This output is also referred to as negative switching or current-sinking.

PNP output

The positive potential here is connected to the load. This output is also known as current sourcing or positive switching.

Switching sequence

The switching sequence is defined as the maximum number of switching from the activated state to the deactivated state in hertz. It is measured using a half sensing range ($\frac{1}{2} S_n$) and a standard target. The measurement value shall be satisfied if either the on-time (t_1) or off-time (t_2) is less than 50 microseconds.

T

Teach-in

→ See „External teach-in“ on page J-295

Temperature classes

→ See „Explosion protection according to ATEX“ on page J-302

Temperature drift (from S_r)

Temperature drift is the shifting of the sensing range or the output signal caused by a change in ambient temperature.

Time delay before availability

The time delay before availability is the time it takes for the proximity sensor to be ready according to the supply voltage.

V

Vibration resistance

According to IEC 60068-2-6

The test shall be conducted in three mutually perpendicular axes under the following conditions:

Frequency range: 10 to 55 Hz

Amplitude: 1 mm

Oscillation period: 5 min

Duration of the service life at resonance frequency or at 55 Hz:
30 min on each axis.

Voltage drop

Voltage drop is defined as the voltage loss that occurs with maximum continuous current I_a across the switching stage of the proximity switch. In particular, this behavior is observed in the series connection.

W

Wire-break protection

Due to a wire-break protection, the output remains locked if the supply cable breaks. Malfunctions are thereby prevented.

Explosion protection according to ATEX

ATEX Directive 94/9

The directive 94/9/EC has created in the European Union the framework for approximation of the laws of the Member States concerning equipment and protective systems for intended use in potentially explosive atmospheres. Generally called ATEX (for "Atmosphère explosible"), this directive was implemented in Germany with the 11th Ordinance of the Equipment and Product Safety Act ("Explosion Protection Regulation"/11th GPSGV). Thus, there exist detailed rules for the marketing of new equipment and protective systems for use in explosion-hazardous area. In accordance with the regulations of the directive, products are classified into equipment groups and categories.

Equipment groups

Equipment group I

Encompasses equipment for use in underground mining including surface equipment.

Equipment group II

Encompasses equipment for use in surface operations and is subdivided into categories 1 - 3.

Categories and criteria

Category 1 – Very high safety measures

Equipment for use in areas (zones) in which explosive atmospheres are present continuously, long-term or frequently. Even for rarely occurring problems, explosion protection must be guaranteed. This category corresponds to Zones 0 for gases, vapors and mists, as well as 20 for dust environments, where explosive atmosphere occurs continuously, long-term or frequently in form of a cloud of combustible dust in the air. The conditions of Zones 0 and 20 might also occur inside boxes, pipe lines and equipment.

Category 2 – High safety measures

Equipment for use in areas (zones) in which explosive atmospheres only occasionally occur. Explosion protection must also be guaranteed for frequently occurring equipment problems. This category corresponds to Zones 1 for gases, vapors and mists, as well as 21 for dust environments, where explosive atmosphere occurs occasionally in form of a cloud of combustible dust in the air under normal operation. This zone can, for example, include areas in the immediate vicinity of e.g. powder filling and emptying points and areas where dust deposits occur and in normal operation give rise occasionally to an explosive concentration of combustible dust when mixed with air.

Category 3 – Normal safety measures

Equipment for use in areas (zones) in which explosive atmospheres are not expected to occur. However, in the event that an explosive atmosphere does occur, it occurs only very rarely and only temporarily. Under normal operation, category 3 equipment must guarantee the required safety measures. The corresponding zones are Zone 2 for gases, vapors and mists, as well as 22 for areas in which under normal operation it not expected that an explosive atmosphere in the form of a cloud of combustible dust in air occurs and if it does, then only briefly. This can include areas around dust containing instruments, protective systems and components in which dust can escape due to lack of tightness and cause dust deposits.

Equipment group II						
Equipment for use in other explosion-hazardous area						
	Category 1		Category 2		Category 3	
Danger	Constant, frequent or over a long period		Occasional		Seldom and over a short period	
Requirement	Very high safety		High safety		Normal safety	
Zone	Zone 0	Zone 20	Zone 1	Zone 21	Zone 2	Zone 22
Substance group	G	D	G	D	G	D

G = Gas, D= Dust.

Certificate

After a test body for a device has ensured compliance with the basic safety requirements, it generates a test report. This test report is the basis for a certificate authority (notified body) to issue an EU-type examination certificate.

The CE and ATEX symbols may only be attached to the product when yet another certificate of a notified body per Directive 97/9 concerning the quality assurance of the production of the products has also been granted for the corresponding product group and when the manufacturer has issued a conformity declaration concerning the conformity of the products with the construction type treated in the EU-type examination certificate.

Principles of explosion protection

To establish uniform standards in the determination of protective measures, flammable liquids and gases are divided into explosion groups and temperature classes based on their explosion-relevant properties.

Explosive groups

Gases and vapors are classified into three explosive groups (IIA, IIB and IIC) based on their specific flammability. The danger increases from explosion group IIA to IIC (the higher IIC explosion group always includes the lower IIB and IIA groups).

Temperature classes

To facilitate the planning of an installation, 6 temperature classes (T1 to T6) have been established for the approved surface temperatures. Depending on their respective ignition temperatures, certain flammable gases and vapors can be classified under these temperature classes. For the temperature classes, the following maximum allowable surface temperatures are valid for equipment (the higher temperature classes encompass the lower classes, e.g. T6 includes the lower temperature classes T5 to T1):

Class	Max. surface temperature		
T1	450 °C	T4	135 °C
T2	300 °C	T5	100 °C
T3	200 °C	T6	85 °C

Ignition protection type

Technical means must be used to ensure that no ignition source can take effect according to the classification of a given explosive mixture (gap width, temperature class). There are several technical possibilities to achieve explosion protection of an electrical device. The types of ignition protection are listed in the table. On the explosive identification label of a device, the type of ignition protection accorded to the device is indicated by the initial letters of the type of ignition protection.

Ignition protection type	Description
Flameproof Encapsulation d (drive enclosure)	The components that could trigger ignition are installed in an housing that withstands the explosion pressure. The openings of the housing are designed such that an outward transmission of the explosion is prevented.
Enhanced safety e (enhanced safety)	The development of sparks, electric arcs, or impermissible temperatures that could function as a source of ignition, is prevented by additional measures and an increased degree of safety.
Pressurized apparatus p (pressurization, purging)	The housing of the devices is filled with a protective gas. An excess pressure is maintained so that an explosive gas mixture cannot reach the possible ignition sources arranged in the interior of the housing. If necessary, gas flows continuously through the housing.
Intrinsic safety i (intrinsic safety)	The supply of the electric equipment is led through a safety barrier that limits current and voltage to such an extent that the minimum ignition energy and ignition temperature of an explosive mixture is not reached.
Oil immersion o (oil immersion)	The parts of the electric equipment from which an ignition can arise are immersed in a protective liquid (mostly oil).
Sand encasing q (quartz filled)	The equipment is filled with fine-grained sand. A possible electric arc is cooled so much that the ignition of an explosive mixture is impossible. The surface temperature must not exceed the limit value.
Molded encapsulation m (molded)	The parts of the electric equipment that can create ignition sources are embedded in casting compound so that an electric arc cannot pass through to an explosive mixture outside the casing.
Ignition protection methods n (non-incendive, non-sparking)	In normal operation and with defined errors, there is no risk of ignition from the electric equipment.

SICK AT A GLANCE

SICK is a leading manufacturer of intelligent sensors and sensor solutions for industrial applications. With more than 7,400 employees and over 50 subsidiaries and equity investments as well as numerous agencies worldwide, we are always close to our customers. A unique range of products and services creates the perfect basis for controlling processes securely and efficiently, protecting individuals from accidents and preventing damage to the environment.

We have extensive experience in various industries and understand their processes and requirements. With intelligent sensors, we can deliver exactly what our customers need. In application centers in Europe, Asia and North America, system solutions are tested and optimized in accordance with customer specifications. All this makes us a reliable supplier and development partner.

Comprehensive services round out our offering: SICK LifeTime Services provide support throughout the machine life cycle and ensure safety and productivity.

For us, that is “Sensor Intelligence.”

Worldwide presence:

Australia, Austria, Belgium, Brazil, Canada, Chile, China, Czech Republic, Denmark, Finland, France, Germany, Great Britain, Hungary, India, Israel, Italy, Japan, Malaysia, Mexico, Netherlands, New Zealand, Norway, Poland, Romania, Russia, Singapore, Slovakia, Slovenia, South Africa, South Korea, Spain, Sweden, Switzerland, Taiwan, Thailand, Turkey, United Arab Emirates, USA, Vietnam.
